## Problem Statement

---

Hina and Hoshino played a game of rock-paper-scissors. Given what each of them put out, did Hina win?

## Task Details

---

Your task is to implement a function named `hina_wins`, which should look like this:

Copy

```
def hina_wins(hina, hoshino):  
    return ...
```

Here, you only need to replace the `...` part with a **Python expression**.

The function must return a `bool` denoting the answer.

Your source code must have at most 500500 bytes.

## Examples

---

Example 1 Function Call

Copy

```
hina_wins("rock", "scissors")
```

**Example 1 Return Value**

Copy

```
True
```

**Example 2 Function Call**

Copy

```
hina_wins("scissors", "rock")
```

**Example 2 Return Value**

Copy

```
False
```

**Constraints**

---

- The function `hina_wins` will be called at most  $10410^4$  times.
- Each of `hina` and `hoshino` is one of `"rock"`, `"paper"`, or `"scissors"`.

**Scoring**

---

**Note:** New tests may be added and all submissions may be rejudged at a later time. (All future tests will satisfy the constraints.)

- You get 100100 ❤️ points if you solve all test cases where:
  - `hina` and `hoshino` are not the same.
- You get 100100 ❤️ points if you solve all test cases.
