Allowed languages

NONE, py3

Problem Statement

Given a string `ss`, append three dots to the end of it if it doesn't already end in three dots.

Note that by "three dots", we mean `...`.

Task Details

Your task is to implement a function named `append_ellipsis`, which should look like this:

Copy

```
def append_ellipsis(s):  
    return ...
```

Here, you only need to replace the `...` part with a **Python expression**.

The function must return a string denoting the answer.

Your source code must have at most 100100 bytes.

Examples

Example 1 Function Call

Copy

```
append_ellipsis("Hello")
```

Example 1 Return Value

Copy

```
"Hello..."
```

Example 2 Function Call

Copy

```
append_ellipsis("Goodbye...")
```

Example 2 Return Value

Copy

```
"Goodbye..."
```

Constraints

- The function `append_ellipsis` will be called at most 10410^4 times.
- `ss` is a (possibly empty) string consisting of English letters and dots of length at most 100100.

Scoring

Note: New tests may be added and all submissions may be rejudged at a later time. (All future tests will satisfy the constraints.)

- You get 5050 ❤️ points if you solve all test cases where:
 - There are no dots in `ss`.
- You get 150150 ❤️ points if you solve all test cases.
