Allowed languages

NONE, py3

Problem Statement

We define a *side comment* as some part of a string that is enclosed in parenthesis (like this).

Given a string s with exactly one side comment, what is the length of the side comment?

Note that the parentheses are *not* included in this length.

Task Details

Your task is to implement a function named `len_side_comment`, which should look like this:

Copy

```
def len_side_comment(s):
    return ...
```

Here, you only need to replace the `...` part with a **Python expression**.

The function must return an integer denoting the answer.

Your source code must have at most 100100 bytes.

Examples

Example 1 Function Call

Copy

```
len_side_comment("We define a side comment as some part of a string  
that is enclosed in parenthesis (like this)")
```

Example 1 Return Value

Copy

```
9
```

Constraints

- The function `len_side_comment` will be called at most 10410^4 times.
- ss is a nonempty string consisting of English letters, spaces, exactly one `(`, and exactly one `)`, and it has a length of at most 100100.
- There is exactly one side comment in ss .

Scoring

Note: New tests may be added and all submissions may be rejudged at a later time. (All future tests will satisfy the constraints.)

- You get 5050 ❤️ points if you solve all test cases where:
 - The first character of ss is a `(`.
 - The last character of ss is a `)`.
- You get 150150 ❤️ points if you solve all test cases.
