

# Line Count - DCS Online Judge

[oj.dcs.upd.edu.ph/problem/linecount](https://oj.dcs.upd.edu.ph/problem/linecount)

## Problem Statement

Given a string  $s$ , how many lines does it have?

Note that lines are separated by the newline (`\n`) character. Also, there may or may not be a trailing newline character; if there is one, then the last newline character merely signifies the end of the last line.

## Task Details

Your task is to implement a function named `line_count`, which should look like this:

Copy

```
def line_count(s):
    return ...
```

Here, you only need to replace the `...` part with a **Python expression**.

The function must return an integer denoting the answer.

Your source code must have at most 7575 bytes.

## Examples

### Example 1 Function Call

Copy

```
line_count("""\
Roses are red
Violets are blue
I like CS 11
And so should you
""")
```

### Example 1 Return Value

Copy

```
4
```

### Example 2 Function Call

Copy

```
line_count("May isa na namang kumagat sa alikabok")
```

### Example 2 Return Value

Copy

```
1
```

## Constraints

---

- The function `line_count` will be called at most  $10410^4$  times.
- `ss` is a nonempty string consisting of English letters, spaces, and newlines of length at most 100100.

## Scoring

---

. **Note:** New tests may be added and all submissions may be rejudged at a later time. (All future tests will satisfy the constraints.)

- You get 5050 ❤ points if you solve all test cases where:
  - Each line in `ss` is nonempty.
- You get 150150 ❤ points if you solve all test cases.
